ARUSHI

Job: Software Engineer (Generative AI)

Company: AJ Bell

I build AI tools and products for use within the organisation, while also enabling greater, more effective AI adoption across the workplace.

Ambitious	Hardworking	Driven

The skills I use most in my job... Software Development

- AI

- Prompt Engineering
- Context Engineering
- Python

The most interesting thing I've worked on in my career so far...A good recent example is the internal AI platform I've been working on at my current organisation. It's been an interesting, multifaceted problem to solve; enabling teams to use AI in a highly regulated financial services environment while keeping things secure, compliant, and practical

What inspired me into digital and tech...I was always really keen on mathematics, and growing up in the new millennium, I was naturally curious about new technological advances. I took to technology like a fish to water, and computer science felt like the natural path forward where I could combine problem-solving with building things.

My educational background is...I did my undergraduate degree in Computer Science Engineering from India and pursued a Master's in Advanced Computer Science specialising in AI and Data from the University of Manchester

What advice I'd give to girls thinking about a career in digital and tech... Go for it! If you enjoy figuring out how things work and solving interesting technical problems, tech can be a great fit. While it can feel male-dominated, finding allies, mentors, and sponsors makes a huge difference; there's plenty of space for you to belong and thrive
